This sequence represents a core peptide of an src homology region 2 (SH2) binding peptide corresponding to the formula: Z7-X-Z8-X X = any D- or L- amino acid; Z7 = hosphotyrosine or its isostere; Z8 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 14 isostere; the amino terminus is acylated, and the peptide is less than 14 is saparagine, then the peptide is not GDCZ7XZ8KPLLL. SH2 binding peptides containing this core peptide are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with defects in receptor tyrosine kinase pathways, by partially blocking or inhibiting a cellular signal transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The present invention describes mimotopes (I) of a surface L3, 7, 9, of meningococcal lipopolysaccharides (LOS) of Neisseria meningitidis comprising a peptide peptide by screening a peptide library with a monoclonal antibody (MAD) like 4BE12C10, H44/24, H44/58, H44/70 or A44/78. (I) is antigenically cross-reactive with MAD. (I) have carbines. MAD is useful in the identification of (I). (I) or MAD are useful as a medicament, and also in the manufacture of a medicament for treating or preventing meningococcal disease. (I) and MAD are useful for treating or preventing from or susceptible to meningococcal disease treating or patient suffering from or susceptible to meningococcal disease. Or assay for meningococcal infection to detect antibodies against L3, 7, 9, LOS and to detect the presence of L3, 7, 9 immunotype meningococcus in a sample from a patient. ADN88481 and ABD47336 to ABD47754 crepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding CAI resistance proteins - used in gene therapy, and for detecting CAI resistance in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Carboxyamido-triazole resistance; CAI; CAIR-1; cancer; gene therapy; Src homology 3; SH3 binding domain.
                                                                                                                                                                                  Novel mimotope of Neisseria meningitidis surface, for treating meningococcal disease, comprising a peptide epitope obtainable by screening peptide library with a specific monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes mimotopes (I) of a surface L3, 7, 9, of meningococcal lipopolysaccharides (LOS) of Neisseria meningitidis comprising a peptide epitope obtained by screening a peptide library with a monoclonal antibody (MAD) like 4BB12C10, H44/24, H44/58, H44/70 or H44/78. (I) is antigenically cross-reactive with MAD. (I) have cartiforerial and antihinflammatory activities, and can be used in vaccines. MAD is useful in the identification of (I). (I) or MAB are useful as a medicament, and also in the manufacture of a medicament for treating or preventing meningococcal disease. (I) and MAB are useful if treating or preventing from or susceptible to meningococcal disease by administering (I) or MAB to the patient. (I) is useful in a diagnostic by administering (I) or MAB to the patient. (I) is useful in a diagnostic assay for meningococcal infection to detect antibodies against L3, 7, 9, LOS and to detect the presence of L3, 7, 9 immunotype meningococcus in a sample from a patient. Sequence 26, Application US/09761636A

Patent No. US20020065218A1

GENERAL INFORMATION:

APPLICANT: APPLICANT: Steven

APPLICANT: CENUBRON, Angela

TITLE OF INVENTION: VEGF-D/VEGF PEPTIDOMIMETIC INHIBITOR

TITLE OF INVENTION: VEGF-D/VEGF PEPTIDOMIMETIC INHIBITOR

TITLE OF INVENTION: VEGF-D/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFERENCE: 1064/48805 Achen et al

CURRENT FILING DATE: 2001-01-18

PRIOR APPLICATION NUMBER: US 60/176,293

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SEQ ID NOS: 34

SEQ ID NOS: 34

Sequence 5, Application US/08212190A
Septent No. 5652223
GENERAL INFORMATION:
APPLICANT: LIOTTA, Lance A
APPLICANT: KIN, Young Sook
TITLE OF INVENTION: DNA ENCODING CAI RESISTANCE PROTEINS AND
TITLE OF INVENTION: USES THEREOF
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: TOwnsend and Townsend and Crew
  Sequence 150, Application US/08471068
Patent No. 5948635
GENERAL INFORMATION:
APPLICANT: Kay, B. K.
APPLICANT: POWLKES, D. M.
TITLE OF INVENTION: Totally Synthetic Affinity Reagents
CORRESPONDENCES: 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    spectral MS/MS techniques
RMATION: Phakellistatin 10 is a
RMATION: cell growth inhibitory peptide with
RMATION: activity in murine lymphocytic leukemia
RMATION: cell line of 2.1 mg/ml.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 41.0%; Score 25; DB 1; Length 8; 66.7%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

Biochemistry 38:11895-11904(1999).

Biochemistry Alpha-conotoxins act on postsynaptic membranes, they bind to the nicotinic acetylcholine receptors (nAChR) and thus inhibit them. The higher affinity site for alpha-conotoxin GI is the alpha/delta site on mouse muscle-deriverd BG3H-1 receptor, and the other site (alpha/damma site) on nicotinic receptors from

-I. FUNCTION: Alpha-conotoxins act on postsynaptic membranes, they bind to the nicotinic acetylcholine receptors (nAChR) and thus inhibit them.
                                                                                                                                                                                                                                                                                                                         -!- SUBCELLUIAR LOCATION: Secreted.

Biochmistry 30:9370-9377(1991).
-!- FUNCTION: Alpha-conotoxins act on postsynaptic membranes,
bind to the nicotinic acetylcholine receptors (nAChR) and
inhibit them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Myers R.A., Zafarella G.C., Gray W.R., Abbot J., Cruz L.J.,

Electrophoresis 20:1098-1108(1999).
Electrophoresis 20:1098-1108 in the regulation of photosystem II.
-!- FUNCTION: May be involved in the regulation of photosystem II.
-!- SUBGELIGIAR LOCATION: Chloroplast thylakoid membrane; associated with the photosystem II complex (By similarity).
-!- MISCELIANBOUS: On the 2D-gel the determined pI of this protein (spot NIT9) is: 5.9, its MW is: 22 kba.
-!- SIMILARITY: Belongs to the psbP family.
Photosynthesis; Photosystem II; Chloroplast; Thylakoid; Membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

-:- TISSUE SPECIFICITY: Expressed by the venom duct.
-:- SIMILARITY: Belongs to the conotoxin A-superfamily. Alpha-type
                                                                                                                                                        Biochemistry 38:6317-6326(1999).
-!- FUNCTION: Alpha-conotoxins act on postsynaptic membranes, they bind to the nicotinic acetylcholine receptors (nAChR) and thus inhibit them. This peptide seems to be a potent and selective
                                                                                                                                                                                                                                             blocker of muscular subtype of nAChR.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin A-superfamily. Alpha-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alpha-conotoxin MI (MI).

bind to the nicotinic acetylcholine receptors (nachR) and thus inhibit them. This peptide blocks mammalian nicotinic acetylcholine receptors composed of alpha-3/beta-4 subunits.
--- SUBCELLULAR LOCATION: Secreted.
--- TISSUB SPECTROITY: Expressed by the venom duct.
--- MASS SPECTROMETRY: MW=1725.6; METHOD=Electrospray.
--- SIMILARITY: Belongs to the conotoxin A-superfamily. Alpha-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Luo S., Kulak J.M., Cartier G.E., Jacobsen R.B., Yoshikami D., Olivera B.M., McIntosh J.M.; "Alpha-conotoxin AulB selectively blocks alpha3 beta4 nicotinic

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human configuration relates to a method of producing a monomeric monocyclic peptide by a measuring beta-configuration of producing a monomeric monocyclic peptide by a measuring beta-configuration the peptide by oxidising the exposed loop of a growth factor protein and cyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior conclisation are used to interfere with angiogenesis, conclisation are used to interfere with angiogenesis, conclisation are used to interfere with angiogenesis, conclisation is diabetic retinopathy, postiast, atthropathy cerebrovascular accident, post-angioplasty restenosis, head, heat or condition is diabetic retinopathy, postiast, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corporated angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a communation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic corputation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic corputation inflammation with an anti-inflammatory agent, to treat a christian continuous expecially rheumatoid arthritis, psoriasis and continuous corputation inflammation with an anti-inflammatory agent, to treat a christian continuous continuous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                        Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

Stacker S,

Hughes RA,

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CC whose 3-dimensional structure is modelled on the expose loop of human CC whose 3-dimensional structure is modelled on the expose loop of human CC wearly (ascular endothelial growth factor). The invention relates to a beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and CC peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, concarterised by angiogenesis, neovascularisation or lymphangiogenesis in neovascularisation or lymphangiogenesis. The condition is diabeted retrinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery creatms, substance-induced neovascularisation of the liver, excessive cerebrovascular accident, post-amignoplasty restenosis, head, heat or claumer with a substance-induced neovascular sequelae, or chronic liver creams, substance-induced neovascular sequelae, or chronic liver confiction. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF. Cor -D and charant inflammatory agent, to treat a chabetic retinant. Gaps diabetic retinopathy Similarity Sequence 17 AA;

diabetic retinopathy

Sequence 17 AA;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine Example 26; Page 49; 102pp; English WPI; 2001-442248/47. residues

```
The adjustic reptresents a uniment with the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human unetained of producing a monomeric monocyclic peptide by a measuring betact beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior or cyclisation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC chevacaterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC checkind angiogenesis, neovascularisation or lymphangiogenesis.

CC recebrovascular accident, post-angioplasty restenosis, arthropathy.

CC recebrovascular accident, post-angioplasty restenosis, anthropathy.

CC recebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascular sequelae, or chronic liver consistent accident, post-angioplasty restenosis in fuduced neovascular sequelae, or chronic liver consistent infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to modulate vascular permeability vascularing the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vascular and himperipheral and himper priparent condition and himperipheral manner present to image to imag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 undersolve represents a dimeric picyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human veget (vascular endothellal growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betace arthon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, to cyclisation or lymphanglogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanglogenesis, neovascularisation or lymphanglogenesis, neovascularisation or lymphanglogenesis, correbrovascular accident, post-angioplasty restenosis, head, heat or carebrovascular accident, post-angioplasty restenosis, head, heat or cremina, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive cremingenesis, head, heat or chromone-related angiogenic dysfunction, diabetes induced neovascular permeability in a mammal (the mammal has a condition characterised by fluid crecumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "A disulfide bond forms between residue 17 and residue 1 of the sequence appearing as AAU04528, forming a dimeric peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a dimeric bicyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; VEGF; vascular endothelial growth factor; angiogenesis; neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabete carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                        hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, periconeal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic
                                                                                                                   whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothellal growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                   sequence represents a dimeric bicyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; VEGF; vascular endothelial growth factor; angiogenesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 89; DB 4; Length 17, Pred. The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vacable (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betact composition of producing a monomeric monocyclic peptide by a measuring betact composition the peptide by oxidising the peptide a growth factor protein and cyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior or cyclisation are used to interfere with angiogenesis.

CC peptides, dimeric bicyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC peptides, and a cyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC recipitation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC reciprovascular accident, post-angioplasty restenosis, head, heat or cold cramma, substance-induced neovascularisation of the liver, excessive corpitation in peripheral limps or in lungs, peritoned neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chromic liver corputation in peripheral limps or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to induced neovascular accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic compination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and contrains and contrains are used to interfere contrains and peripheral activity induced by VEGF, VEGF, Cor D and are also used in combination with an anti-inflammatory agent, to treat a contrain contrains and peripheral act

The sequence represents a monomeric monocyclic peptide of the invention, whose 3 dimensional structure is modelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior conception are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis, The condition is diabetic retinopathy, psoriasis, arthropathy, post-recovery carbonare and a condition of the period of the condition of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The poptides are used to image blood vessels and lymphatic with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a sinceric continuation, especially rheumatoid arthritis, psoriasis and although and arthritis, psoriasis and
neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

Example 25; Page 47; 102pp; English.

or cold

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vegeb (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior cyclising the peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis.

CC draracterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC crebrovascular accident, post-angioplasty restenosis, head, heat or clauma substance-induced neovascularisation of the liver, excessive or frauma, substance-induced neovascularisation of the liver, excessive or frauma, substance-induced neovascularisation of the liver accumulation in peripheral limbs or in lungs, peritoneal cavity, accumulation in peripheral limbs or in lungs, peritoneal cavity, accumulation in peripheral limbs or in lungs, peritoneal cavity, accumulation in peripheral limbs or in lungs, peritoneal cavity, accumulation in peripheral activity induced by VEGF-C or D and characterised by Apperience of chronic inflammation with an anti-inflammatory agent, to treat a charinomark. diabetic retinopathy

The condition is diabetic retinopathy, psoriasis arthropathy, corebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corporation induced neovascular sequelae, or chronic liver carquelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal limbs or in lungs, peritoneal cavity, pleura, corbrain. The peptides are used to image blood vessels and lymphatic cor brain. The peptides are used to image blood vessels and lymphatic avaculature. The monomeric and bicyclic peptides are used to interfere

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the modulate strateging them, and their use for identifying agents that polynucleotides encoding them, and their receptors VEGFs and their modulate interactions between VEGFs and their receptors play an important role in vasculogenesis, the development of receptors play an important role in vasculogenesis, the development of the embryonic vasculature from early differentiating endothelial cells and analogenesis, the process of forming new blood vessels from presents ingled cancers, abnormal angiogenesis, may be used to treat dysfunction of the endothelial cell regulatory proliferative retinopathies, age-related macular degeneration, rheumatoid arthritis and psoriasis. The polypeptides of the invention exhibit unique arthritis and psoriasis. The polypeptides of the invention exhibit unique acceptors binding profiles compared to known naturally occurring vEGFs. AAU08479-AAU08483 represents peptides which inhibit human VEGF-C mediated activation of VEGFR-3
                                                                                                                                                                                                                                                                                                                                ö

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the polymulate interactions between VEGFs and their teceptors. VEGFs and their modulate interactions between VEGFs and their receptors. VEGFs and their faceptors play an important role in vasculogenesis, the development of the embryonic vasculature from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from presents in the process of forming new blood vessels from presents on treat dysfunction of the endothelial cell regulatory system. Such disorders include cancers, abnormal angiogenesis, rhe polypeptides of the invention exhibit unique comparing profiles compared to known naturally occurring VEGFs.
                                                                                                                                                                                                                                                                                                                      Human; vascular endothelial growth factor; VEGF-C; vasculogenesis; angiogenesis; blood vessel; cancer; proliferative retinopathy; psoriasis; age-related macular degeneration; rheumatoid arthritis; cardiovascular; VEGFR-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptides that bind cellular receptors for vascular endothelial growth factors, polynucleotides encoding them.
                                                                                                                                                                                                                                                                                        Peptide #3 inhibiting human VEGF-C mediated activation of VEGFR-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 64; Page 147; 261pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAM10101-29 are biologically active peptides a fragments of the agouti signalling protein (ASP) which have depigment activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such occurs at sites of wound healing. They can also be used to provide enhanced equal and active treating eg. vitiligo, leucoderma, some

Patent No. 6610833
GENERAL INFORMATION:
APPLICANT: ROGMEN, Toby C.
TITLE OF INVENTION: Monoclonal Human Natural Antibodies
CURRENT APPLICATION NUMBER: US/09/462,118
CURRENT FILING DATE: 1999-12-18
NUMBER OF SEQ ID NOS: 36
SOFTWARE: FastSEQ for Windows Version 3.0
                                                  COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/685,589A
FILING DATE: 24-UUL-1996
CLASSIFICATION: 530
